

a stance-memory campaigns ($N = 10^5$ unless marked)**b** orientation-memory campaigns, $\lambda = 26.5$, $N = 10^5$ 

Intervals are NOMINAL fixed-sample Wilson 95% intervals. Replicate counts are adaptive (pilot of 50 extended from $\hat{p}$, cap 1200, pilot pooled), so coverage under the realized design has not been assessed. Counts are printed per cell. The $N = 10^6$ cells at $\lambda = 2$ (open stars) are OUTSIDE the adaptive rule: a fixed 50-run design, not piloted and not extended, with no precision target.
